

# Program 1

**Below you will find two exercises from the textbook:**

2. Write a value-returning function, `isVowel`, that returns the value `true` if a given character is a vowel and otherwise returns `false`.
3. Write a program that prompts the user to input a sequence of characters and outputs the number of vowels. (Use the function `isVowel` written in Programming Exercise 2.)

**Program 1 will prompt the user for a string. Assume that the string can contain spaces. Your program will read the string and then determine how many vowels it**
